

Claude for Financial Services

What it is, and where we stand

Internal briefing

June 2026

Informational — no procurement ask

What this deck is — and isn't

Is:

- An honest account of what Claude for Financial Services is
- A clear statement of what we can and cannot do with it today
- Pragmatic guidance for working well with what we have

Isn't:

- A procurement ask
- A criticism of M365 Copilot
- Encouragement to use personal Claude accounts for office work

What it is

The headline

On **5 May 2026**, Anthropic launched Claude for Financial Services:

- **10 ready-to-run agent templates** for high-volume FS work
- **Deep integration with Microsoft 365** (Excel, PowerPoint, Word, Outlook)
- **MCP-based connectors** to ~11 financial data providers
- **Enterprise controls**: SSO, SCIM, audit logs, ISO/IEC 42001:2023

Underlying model: **Claude Opus 4.7** — leads Vals AI Finance Agent benchmark at **64.37%**.

The 10 agent templates

Research & Client Coverage

Pitch Builder	Target lists → comps → pitchbook + cover note
Meeting Preparer	Client / counterparty briefs ahead of calls
Earnings Reviewer	Transcripts + filings → model updates + flagged changes
Model Builder	Builds models from filings, feeds, analyst inputs
Market Researcher	Sector / issuer tracking; news + filings + broker synthesis

Finance & Operations

Valuation Reviewer	Checks valuations vs comparables and firm standards
GL Reconciler	Reconciles GL accounts; NAV calculations
Month-End Closer	Close checklist, journal entries, close reports
Statement Auditor	Statement consistency and audit-readiness review
KYC Screener	Assembles entity files, packages escalations

How each template is built

Each template is a **bundle of three layers**:

1. **Skills** — markdown instructions and domain knowledge (*“how a senior banker does this”, written down*)
2. **Connectors** — governed MCP access to data (Daloopa, FactSet, S&P, Moody's, ...)
3. **Subagents** — specialised Claude models the main agent calls for sub-tasks

Design innovation: **skills are inspectable markdown, connectors are scoped, subagents are addressable**. Not a black box.

Microsoft 365 integration

This is the overlap with our existing M365 Copilot.

App	What Claude does
Excel	Builds models from filings + data feeds; audits formulas; sensitivities
PowerPoint	Drafts decks that auto-update when numbers change
Word	Edits credit memos against firm templates
Outlook	Drafts cover notes for pitchbooks

Independent benchmark: **83%** on complex Excel tasks (Financial Modeling World Cup, via FundamentalLabs).

MCP-based, governed, scoped, auditable:

Daloopa · Morningstar · S&P Global · FactSet · Moody's

MT Newswires · Aiera · LSEG · PitchBook · Chronograph · Egnyte

Not a model scraping the web. **Governed, auditable connections** — the form of integration regulated firms actually need.

How it ships

Three access paths

Path	What you get	Requires
A. M365 + Cowork	The polished, in-the-flow path	Claude Team / Enterprise + M365 plugin install
B. Claude Code	Developer-facing terminal flow	Claude Code subscription
C. Managed Agents	Programmatic, autonomous	Org Anthropic API + engineering

Where we stand

What we have — and don't

Have

- ✓ Microsoft 365 Copilot
- ✓ GitHub Copilot

The full list of sanctioned office AI tooling.

Don't have

- ✗ Claude.ai (consumer)
- ✗ Claude Team / Enterprise
- ✗ Claude for M365 plugin
- ✗ Claude Cowork
- ✗ Claude Code
- ✗ Anthropic API (org-level)

No path from M365 Copilot or GitHub Copilot to the Claude FS agents. The two product families are separate.

On personal accounts

Some of us hold personal Claude subscriptions. Important boundary:

A personal account is **not a sanctioned channel for office work**.

- No DPA with our firm.
- No audit logging into our compliance posture.
- Default Anthropic retention (not enterprise zero-retention).

Personal Claude is for personal exploration. Office work goes through office-sanctioned tools.

This is true regardless of how useful the output looks.

What we are NOT saying — and what we ARE

NOT

1. **Not** that M365 Copilot is bad. Strong for FS work inside M365 surfaces.
2. **Not** that Claude is necessarily better. Different shapes; comparison is task-dependent.
3. **Not** lobbying for procurement. Informational only.
4. **Not** encouraging personal-account workarounds.

ARE

1. The Claude FS offering is real, well-engineered, relevant to our discipline.
2. We don't have access through any office channel today.
3. Understanding what it is helps us make informed tooling judgements.

What we can do today

Where M365 Copilot earns its keep for FS

Task	Why it works
Drafting client emails, cover notes	Outlook native context
Summarising Teams meetings	Live transcript + speakers
Summarising SharePoint trees	Native indexing
First-cut models in Excel	Scaffolds from a written spec
Sensitivity on existing models	Vary X by $\pm 10\%$, show Y
Drafting dashboard commentary	Reads data, writes narrative
Reconciling vs Dynamics 365 / SAP	If connectors installed
Summarising credit memos in Word	With file open in Word

Pattern: anything inside M365 that benefits from knowing what's around it.

Where M365 Copilot is weak for FS

Task	Why
Building a model from a filing	Reasonable; complex modelling not its strength
Multi-doc synthesis across 200 pages	Useful context degrades
Source attribution on every claim	Inconsistent
Pulling from FactSet / S&P / PitchBook	No native connectors
Autonomous multi-step workflows	Requires Copilot Studio build
Complex Excel formula-chain auditing	Improving; below Claude on FMW tasks

Implication: route the task to the surface that fits. Don't force Copilot into things it's weak at.

What to tell colleagues asking about Claude

Clean two-sentence version

Yes — Anthropic launched Claude for Financial Services in May. It's a strong product for our type of work, but we don't have a sanctioned channel to use it: our office AI tooling today is Microsoft 365 Copilot and GitHub Copilot, and Claude requires a separate subscription we haven't acquired.

If they push: “can I just use my personal account?”

Not on office data, no — that would be a data-handling issue regardless of how useful the output is. Personal Claude is fine for personal exploration; office work goes through office-sanctioned tools.

Summary

Summary

- Claude for Financial Services is **real, polished, relevant** — 10 FS agents, M365 integration, governed FS data connectors, enterprise controls.
- We **don't have access** through any current office channel; M365 Copilot + GitHub Copilot are our tools today.
- M365 Copilot is **well-suited** to a large slice of FS work; route tasks intelligently.
- The Anthropic FS repo is **Apache 2.0** — worth reading as reference material even without subscription access.
- This briefing is **informational**, not a procurement ask.

Thank you
